

# Benzodiazepine dependence and treatment strategies; myths versus reality

Prof. dr. R.C. Oude Voshaar

Workshop “De schrik van je leven”, Leuven, 17-10-2019

# Indicaties voor benzodiazepinen

Indicaties	Opmerkingen
1. Slaapstoornissen	<ul style="list-style-type: none"><li>Twee keus na slaaphygiëne en CGT-I</li><li>Enkel kortdurend i.v.m. tolerantie</li></ul>
2. Angststoornissen	<ul style="list-style-type: none"><li>Mogelijk minder effectief dan antidepressiva</li><li>Risico op afhankelijkheid</li><li>Wel rol bij therapieresistente angststoornissen</li></ul>
3. Alcoholdetoxificatie	<ul style="list-style-type: none"><li>Bewezen effectief in tegengaan onthoudingsverschijnselen, verkleind risico op insulten, delier en cognitieve problemen</li></ul>
4. Katatonie	<ul style="list-style-type: none"><li>Zeer effectief, m.n. lorazepam</li></ul>
5. Delier	<ul style="list-style-type: none"><li>Enkel wanneer sedatie vereist is.</li></ul>
6. Acute opwinding	<ul style="list-style-type: none"><li>Psychiatrie: In combinatie met antipsychotica</li><li>Intensive care: Anaestheticum (propofol) eerste keuze</li></ul>
7. Status epilepticus	<ul style="list-style-type: none"><li>Tolerantie bij onderhoudsbehandeling</li></ul>
8. Start antidepressiva	<ul style="list-style-type: none"><li>Initiële angsttoename bij start antidepressiva</li></ul>

# Contra-indicaties benzodiazepinen

---

## Absolute contra-indicaties:

- Myasthenia Gravis
- Overgevoeligheid voor benzodiazepinen

## Relatieve contra-indicaties:

- Ademhalingsdepressie (m.n. bij risicotatiënten zoals COPD of slaapapneu)
- Alcohol- of drugsverslaving in de voorgeschiedenis
- Ernstige leverproblemen (enkel voor BZD die gemetaboliseerd worden)

# Long-term benzodiazepine use

---

Year prevalence in the population<sup>1</sup>:

- Incidental usage: 6.2 – 17.6%
- Long-term use (> 6 months): 3.1 – 3.8%

Associated with many adverse effects:

- Increased risk on falls, hip fracture and traffic accidents
- Memory problems (and decline over time?!)
- Dependence

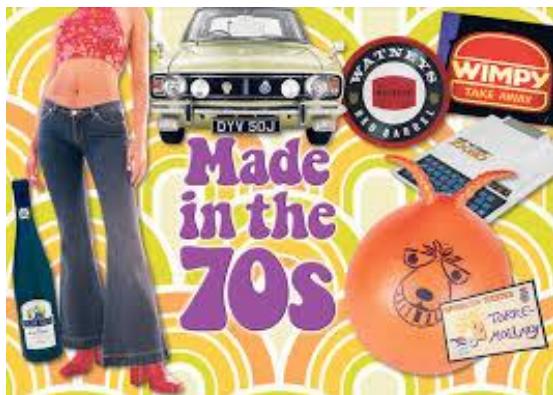

# A historical perspective

Introduction chlordiazepoxide ('60) & diazepam ('63)

First case reports:

- Withdrawal symptoms after dose-escalation  
(e.g. Hollister, 1961)

First scientific discussions

- Marks (1978): 1 in 5 million patients will become addicted  
*versus*
- Lader (1978): "Benzodiazepine – The opium of the masses?"
- Tyrer (1974): "Benzodiazepine Bonanza"

# Dose escalation therapeutic users<sup>1</sup>

Variable	1–6 months		7–12 months		13–18 months		19–24 months	
	N or median	% or range <sup>a</sup>	N or median	% or range	N or median	% or range	N or median	% or range
<b>Median dosage</b>								
New recipients (N=460)	9.1	5.9–13	10.1	6.2–14.6	10.2	6.1–15	10.1	6.4–15.5
Continuing recipients (N=1,980)	9.7	6.4–13.8	10.1	6.6–14.6	10.2	6.5–14.6	10.0	6.5–14.9
Number of recipients with a high dosage <sup>b</sup>								
New recipients	— <sup>c</sup>	—	10	2.2	17	3.7	14	3
Continuing recipients	—	—	14	.71	24	1.2	26	1.3

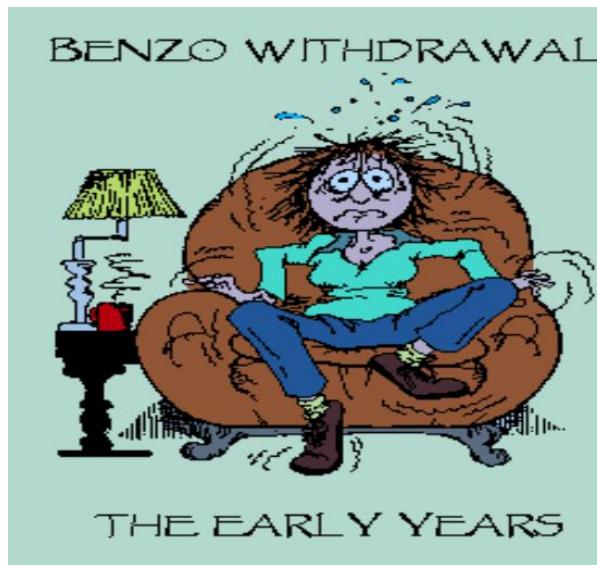

<sup>a</sup> Interquartile range

<sup>b</sup> Average daily dosage at least 20 DMEs for recipients aged 65 years or older and at least 40 DMEs for those aged less than 65 years

<sup>c</sup> Cohort defined as starting on dosages within the therapeutic range; escalation to a high dosage can occur during the next three periods

# Withdrawal after long-term therapeutic use<sup>1</sup>

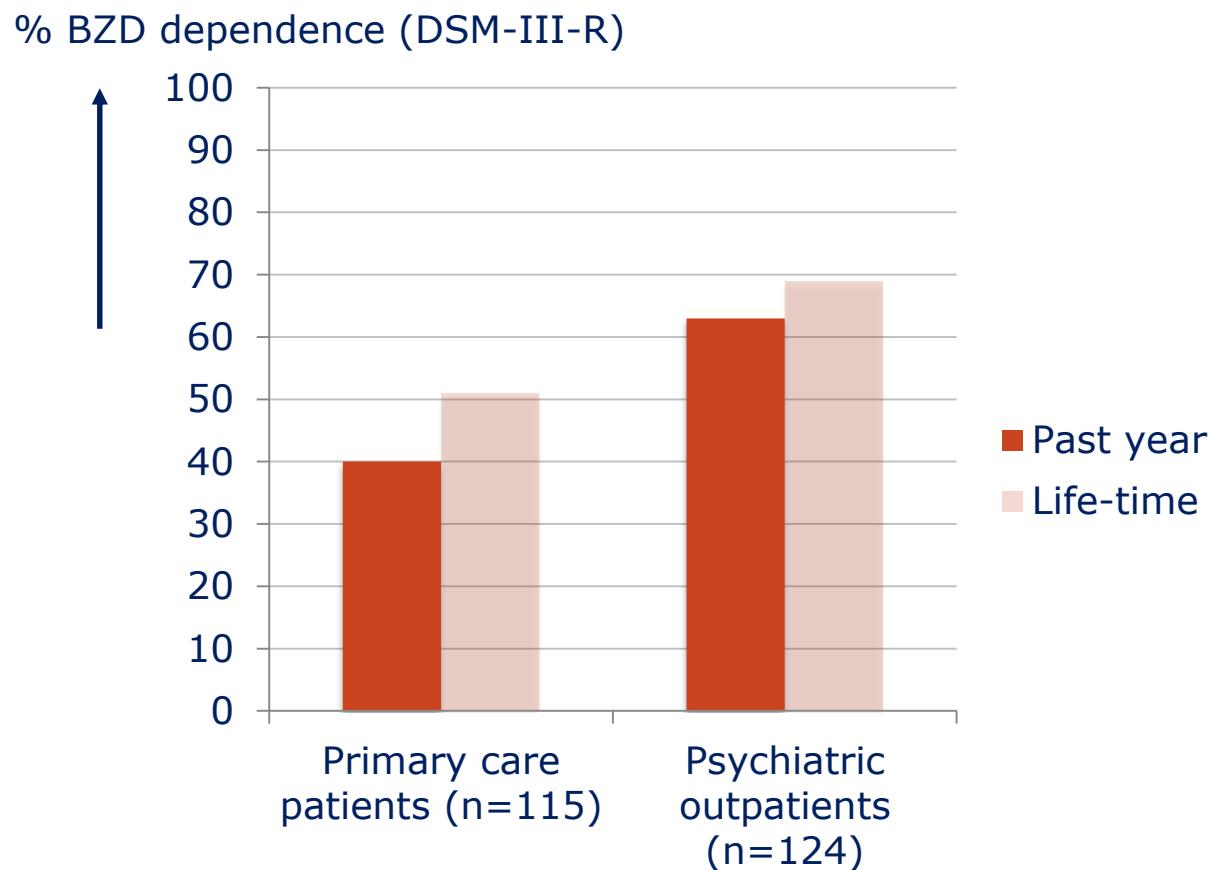

Double-blind, placebo controlled trial (n=40) of placebo versus diazepam tapering

## Results:

- More (withdrawal) symptoms in placebo group
- More dropouts in placebo group
- Some withdrawal symptoms different from anxiety (e.g. tinnitus, involuntary movement, perceptual changes)

# 1997: First prevalence study

## Other side-effects of benzodiazepines

---

- Traffic accidents
- Falls & hip fractures
- Cognitive side-effects & dementia
- Mortality

# Verkeersongevallen

- Meta-analyses<sup>1,2</sup>
  - RR=1.6 (patient-controle onderzoek)<sup>1,2</sup>
  - OR= 1.6 – 1.8 (cohort studies)<sup>1,2</sup>
  - OR= 7.8 wanneer gecombineerd met alcohol<sup>2</sup>
  - Experimentele studies: laterale afwijking (SMD=0.8, p<.001)<sup>1</sup>
- Methodologisch beste studie (Barbone et al, Lancet 1998)
  - OR = 1.6 [95% CI: 1.4 – 2.1] (within-person design)
  - Dosisresponse effect, zowel kort als lange halfwaardetijd.

# Hip fracture in nursing home residents

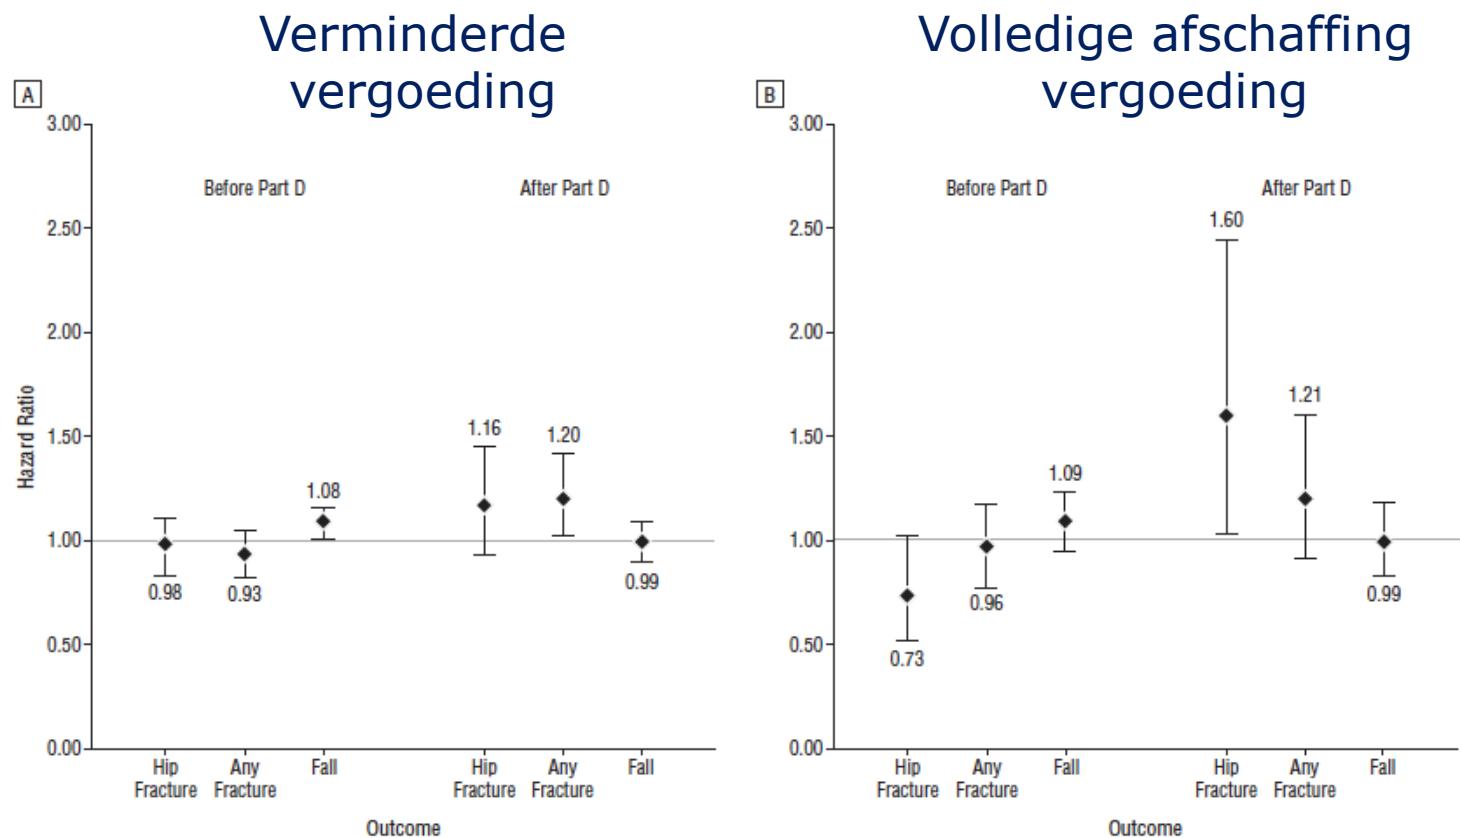

- Valrisico mogelijk hoger in verpleeghuissetting<sup>1</sup>
- Valrisico m.n. gevolg van sedatie en cognitieve beperkingen<sup>2</sup>
- Stoppen BZD-hypnotica gebruik in VHP (n=26, gem 79 jaar)<sup>2</sup>:
  - Betere stabiliteit
  - Verbetering cognitieve maten
  - Geen verslechtering slaap

1 Ray et al, Drug Saf 2002

2 Tsunado et al, Int J Geriatr Psychiatry 2010

# Paradox: Valrisico ↑ na staken BZD in VPH<sup>1</sup>

# Cognitive functioning

## Cognitive effects of chronic use<sup>1</sup>:

- Meta-analyse (13 studies) of 12 cognitive domains
- Mean effect size: -0.74 (SD +/- 0.25), range (-1.30 through -0.42)

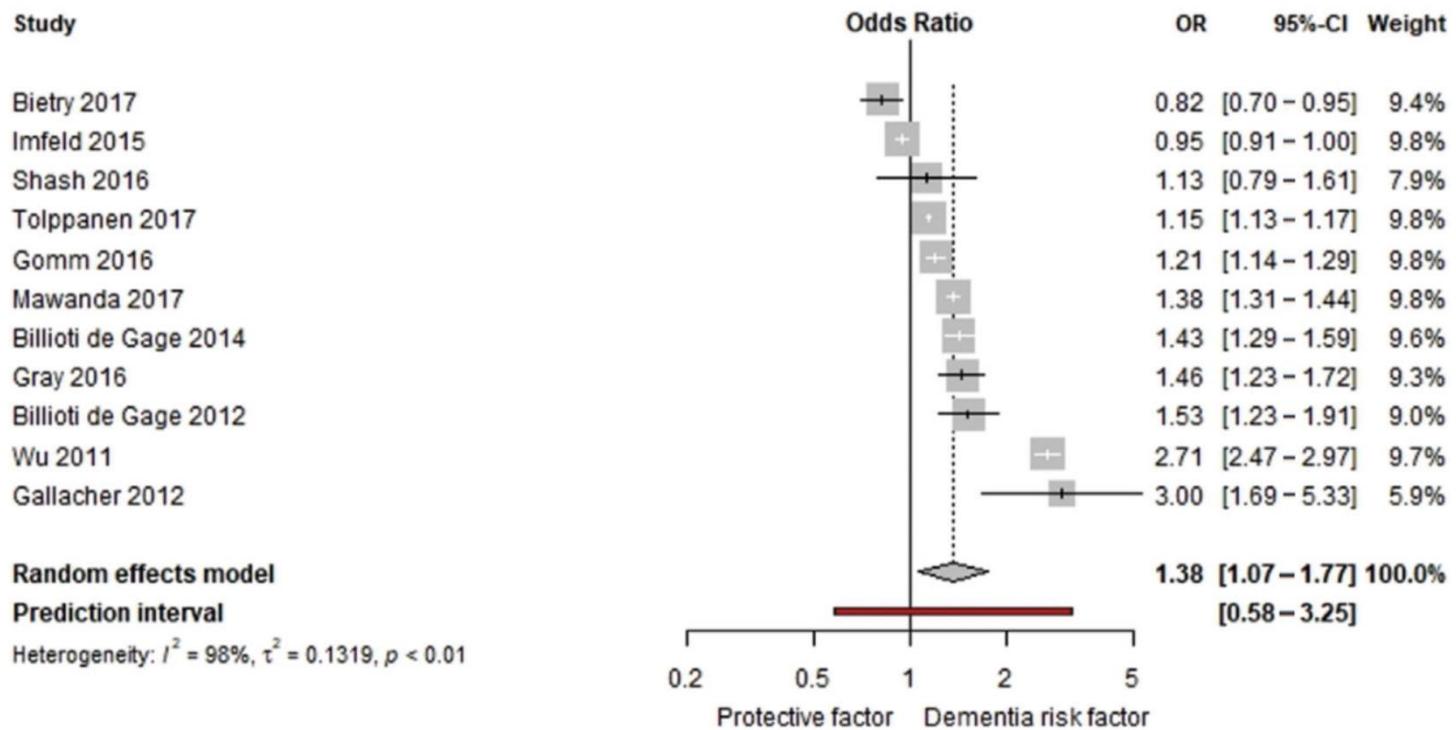

## Long-term effects (LASA)<sup>2</sup>:

- 435 / 2105 BZD-users
- Duration of use and cumulative dose predicts cognitive decline.
- Small effect-size ( $F^2 < 0.01$ )

<sup>1</sup> Barker et al, CNS Drugs, 2004

<sup>2</sup> Biermans, Int J Geriatr Psychiatry 2005

# BZD-related risk of dementia

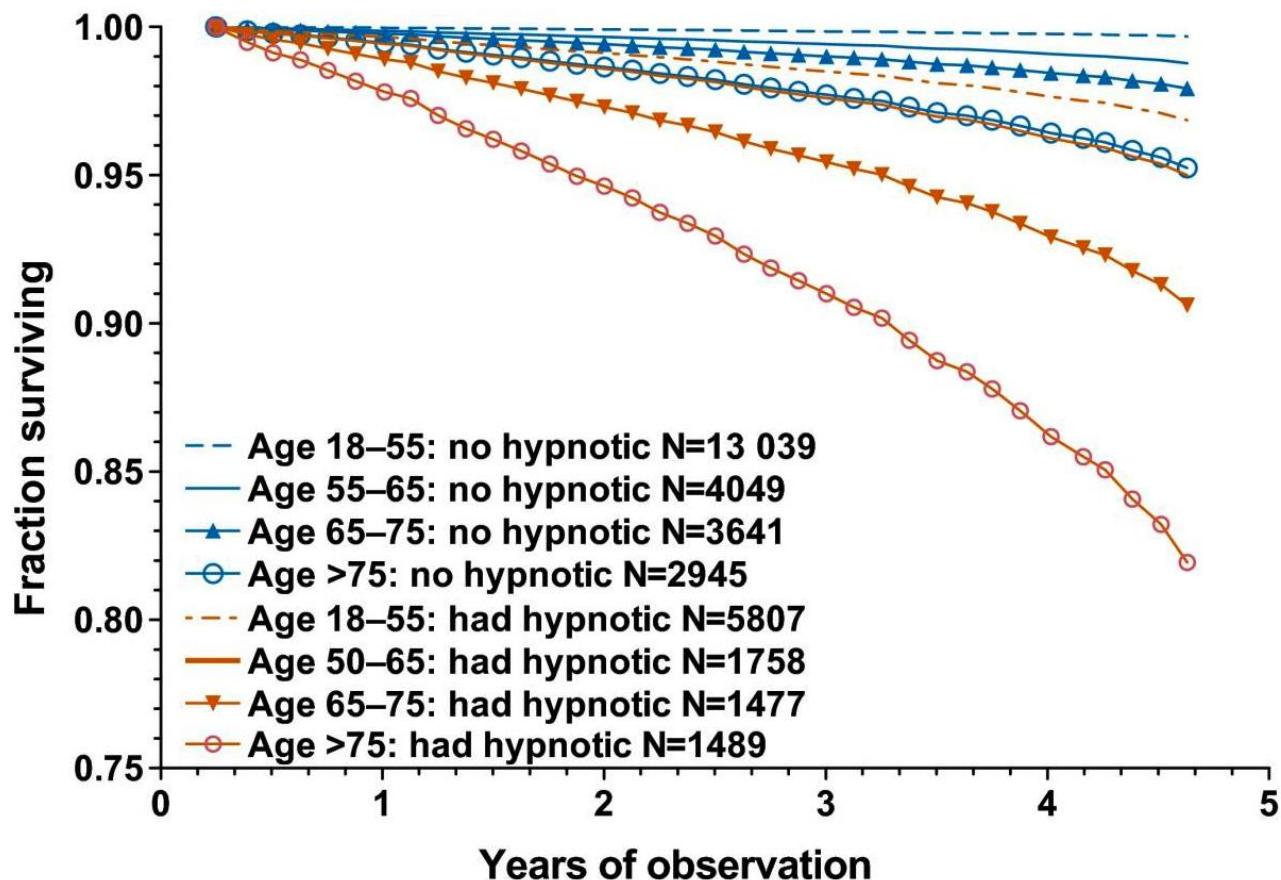

# BZD-related mortality risk<sup>1</sup>

- 18/24 positive studies
- Kripke et al (BMJ 2012)
  - N = 10 529 with a follow-up of 2.5 years
  - Well-adjusted for confounders, especially chronic disease
  - Dosis-effect response:
    - 0.4 – 18 doses / year: HR = 3.6
    - 18 – 132 doses / year: HR = 4.4
    - > 132 doses / year: HR = 5.3

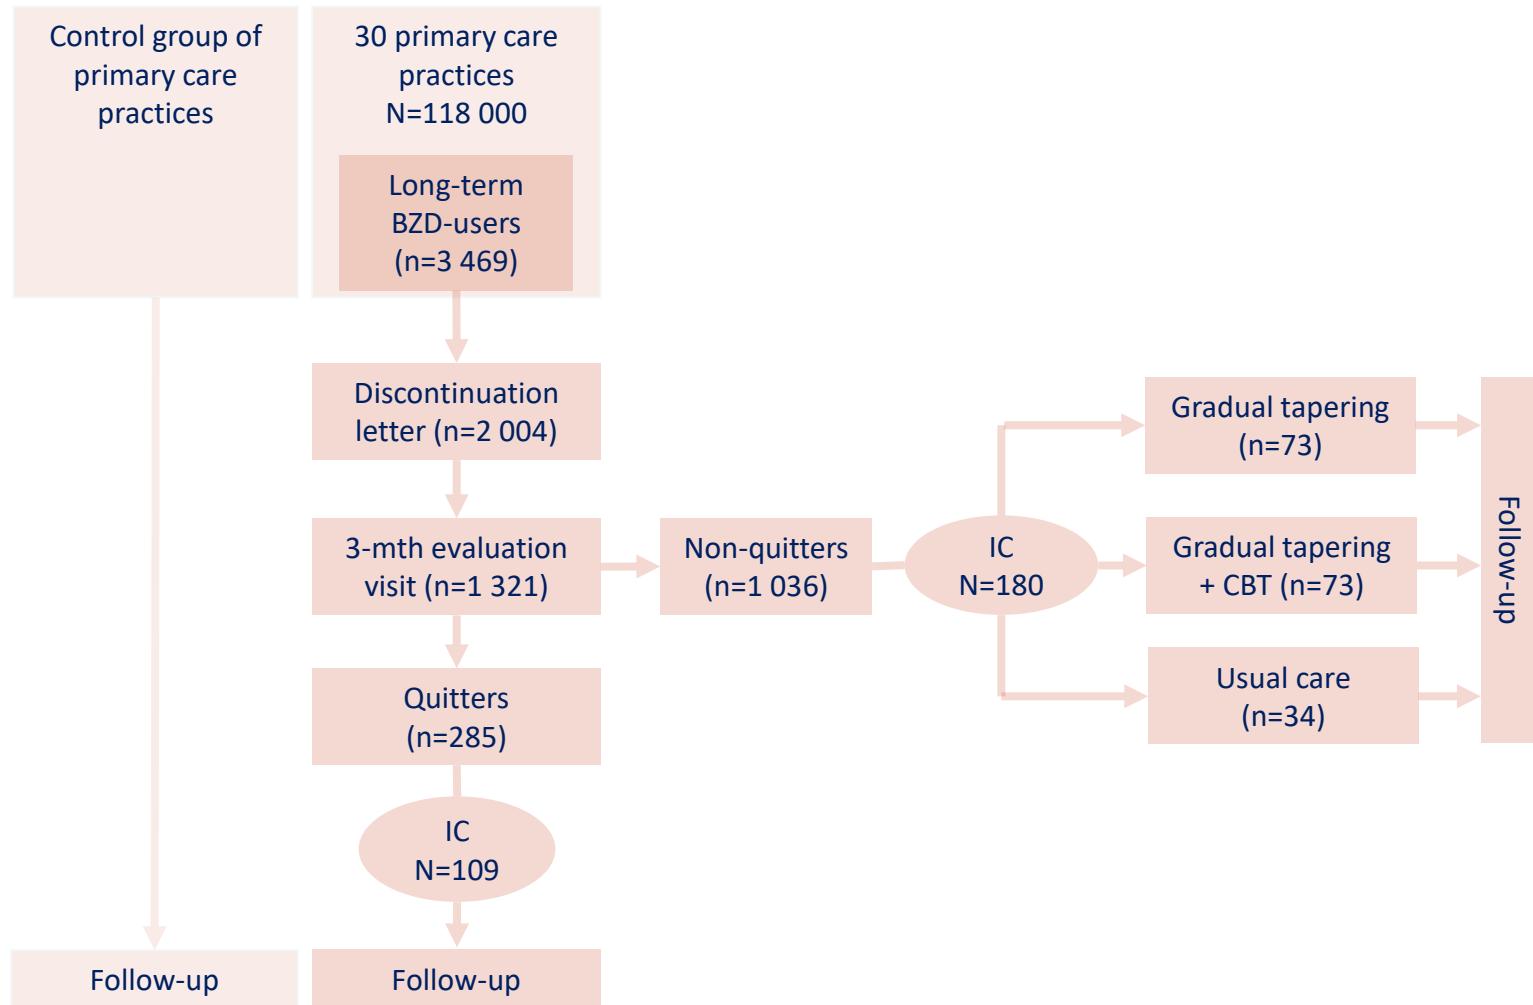

## Hypnotic use and age: effects on survival

umcg

# BenzoRedux project:

## Not only patients worry.....

---

Some worries of the general practitioner:

- Feel ashamed to advise discontinuation after 20 years
- Feasible for the oldest old (>90 years)?
- Patients will request other, more toxic pills
- Medical consumption will increase

umcg

# BenzoRedux project: Part I

# Results discontinuation letter<sup>1,2</sup>

---

Main effects discontinuation letter in primary care<sup>1</sup>:

- Quitters at 6 months: 24% vs 12% (RR=2.1 [95% CI: 1.8–2.4])
- Full abstinence over 21 months: 13% vs 5% (RR=2.6 [95% CI: 2.0–3.4])
- Mean dose reduction vs control: 21.5 PDD [95% CI: 8.2–16.8]

Secondary effects<sup>2,3</sup>:

- No increase in medical consumption<sup>2</sup>
- No substitution for other (psychotropic) drugs<sup>3</sup>

<sup>1</sup> Gorgels et al, Drug Alc Dependence 2005

<sup>2</sup> Gorgels et al, Scand J Prim Health Care 2008

<sup>3</sup> Gorgels et al, Fam Pract 2007

# Predictors of effectiveness<sup>1</sup>

---

*Adjusted hazard rate [95% CI]:*

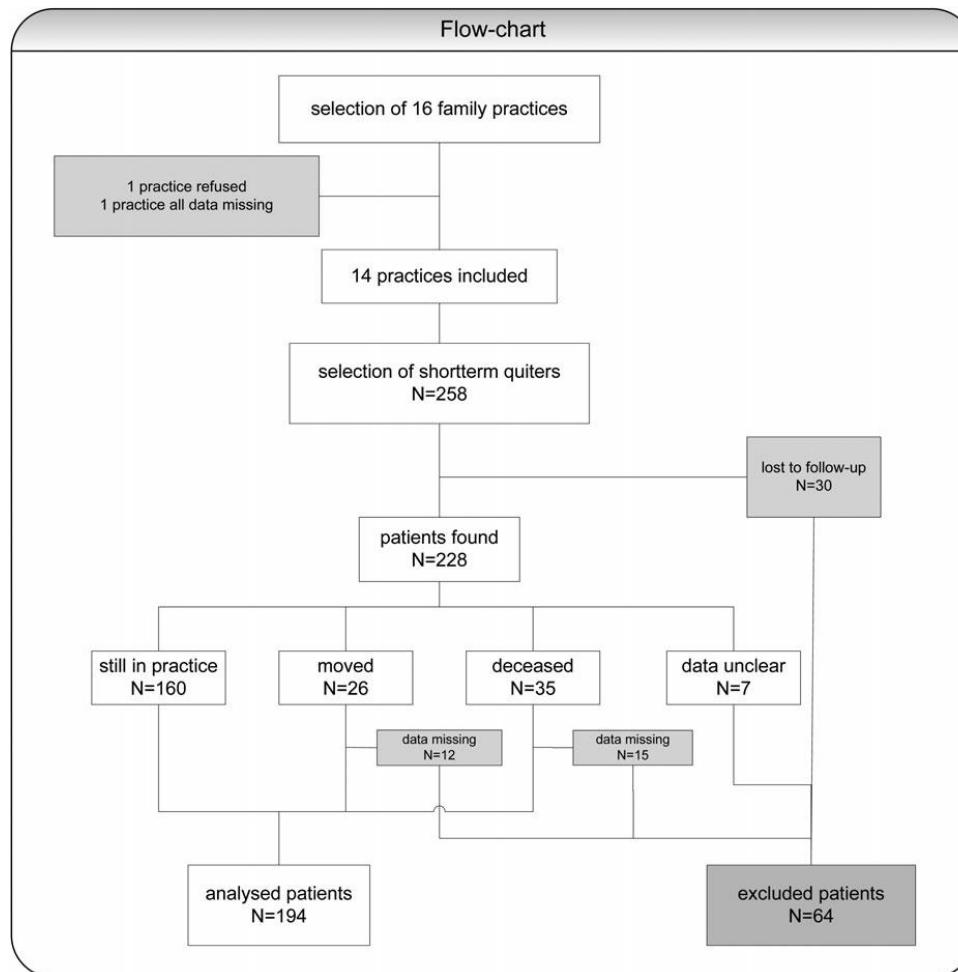

Predictors of long-term discontinuation<sup>2</sup>:

- Male sex 1.7 [1.3 – 2.5], p<.001
- Dosage      ≤65 PDD      *Reference*  
                  >65 ≤130 PDD      0.3 [0.2 – 0.4], p<.001  
                  >130 PDD      0.2 [0.1 – 0.4], p<.001
- Duration of use: ≤24 months      *Reference*  
                  >24 ≤120 months      0.5 [0.3 – 0.8], p<.001  
                  >120 months      0.2 [0.1 – 0.4], p<.001
- Use of a BZD with a half-life <24h 1.7 [1.1 – 2.5], p=.01

# Predictors of effectiveness<sup>1</sup>

Adjusted hazard rate [95% CI]:		
Predictors of long-term discontinuation <sup>2</sup> :		
• Male sex	1.7 [1.3 – 2.5], p<.001	Reference
• Dosage	≤130 PDD	0.3 [0.2 – 0.4], p<.001
	>65 ≤130 PDD	0.2 [0.1 – 0.4], p<.001
	>130 PDD	0.5 [0.3 – 0.8], p<.001
• Duration of use: ≤24 months	Reference	0.2 [0.1 – 0.4], p<.001
	>24 – 120 months	0.5 [0.3 – 0.8], p<.001
	>120 months	1.7 [1.1 – 2.5], p=.01
Age!		
No negative impact of old age!		
Even not in those over 75 years of age!		

# Continued abstinence: a 10 year follow-up<sup>1</sup>

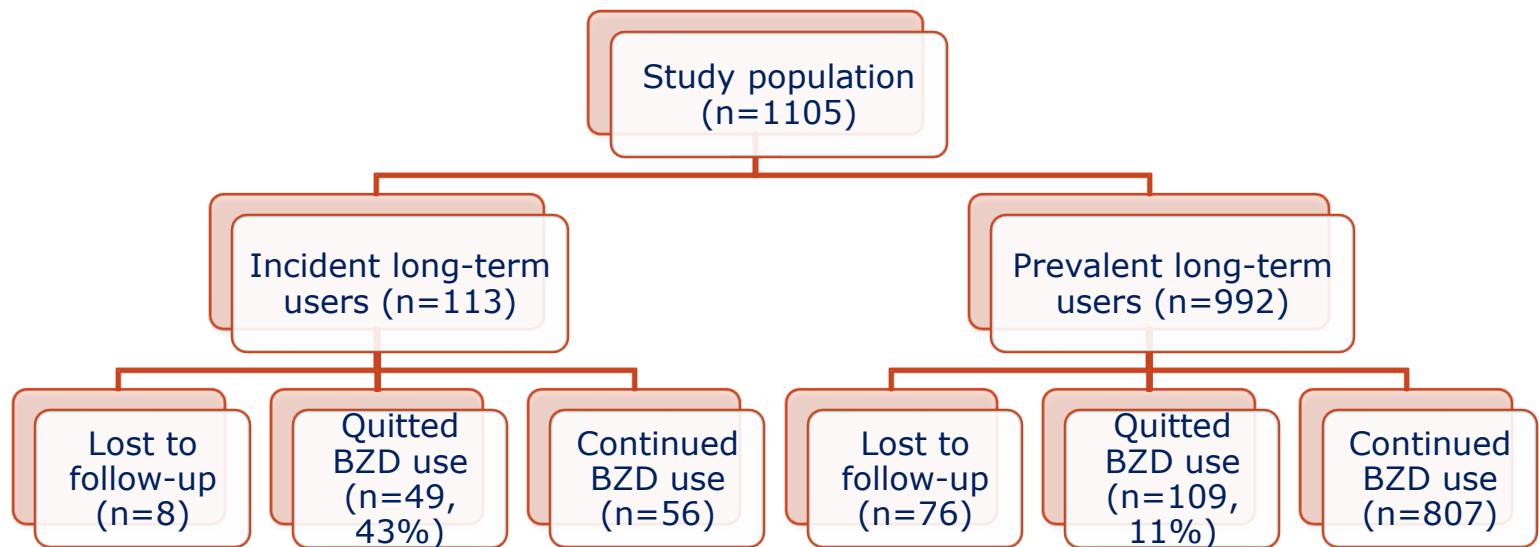

Only two predictors of continued abstinence over 10 years:

- Continued abstinence during first 21 months ( $OR=4.4$  [2.2-8.7],  $p<.001$ )
- Visitor of evaluation visit 3 months after the letter ( $OR=2.1$  [1.0 – 4.3],  $p=.044$ )

# The natural course of long-term BZD use<sup>1</sup>

Does tolerance to BZD use lead to dose-escalation in primary care?

# The natural course of long-term BZD use<sup>1</sup>

Control group of the BenzoRedux project:

	Regression coefficient (SEM)	P-value
Total group of BZD users (n=863)	0.034 (0.148)	.817
• Incident long-term users (n=56)	0.639 (0.543)	.240
• Prevalent long-term users (n=807)	-0.008 (0.153)	.960

No impact of:

- Old age (<50, 50-75, > 75 years)
- Sex
- High dose usage (use of more than 2 DDD per day)

<b>Lack of compliance (Bendep-SRQ)</b>	<b>4.5 [2.3–8.8]</b>	<b>2.4 [1.1–5.2]</b>
Negativism (MMPI)	1.0 [1.0–1.1]	-
Tension (POMS)	1.0 [1.0–1.1]	-

<sup>a</sup> Only corrected for treatment condition

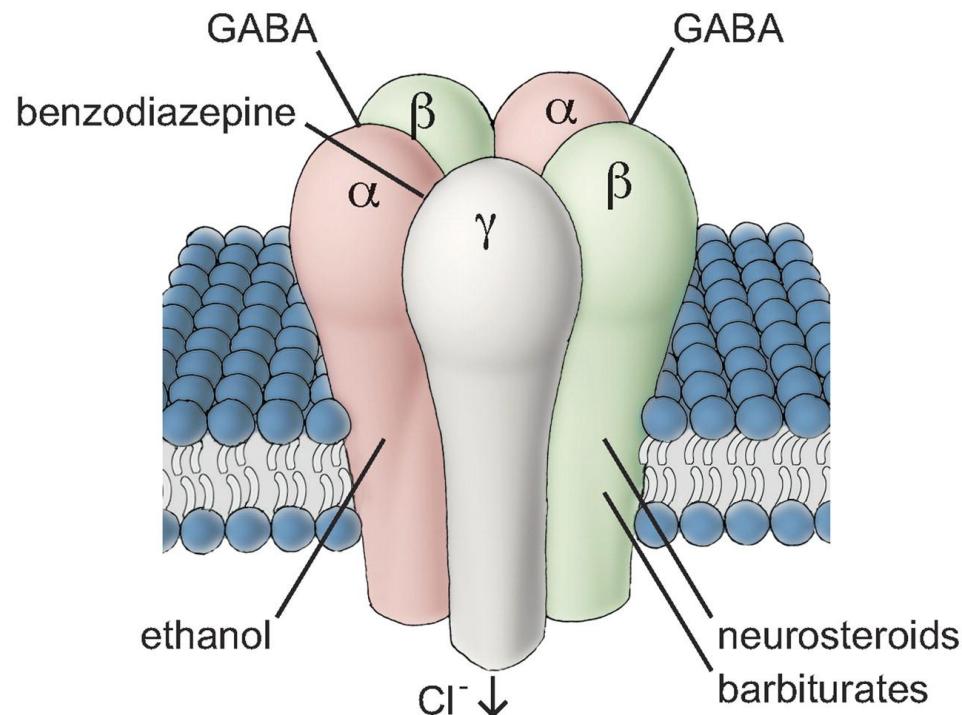

# Impact of craving on relapse<sup>1</sup>

- The Benzodiazepine Craving Questionnaire (BCQ) assesses craving reliably.
- Craving is a risk factor for relapse after BZD discontinuation.

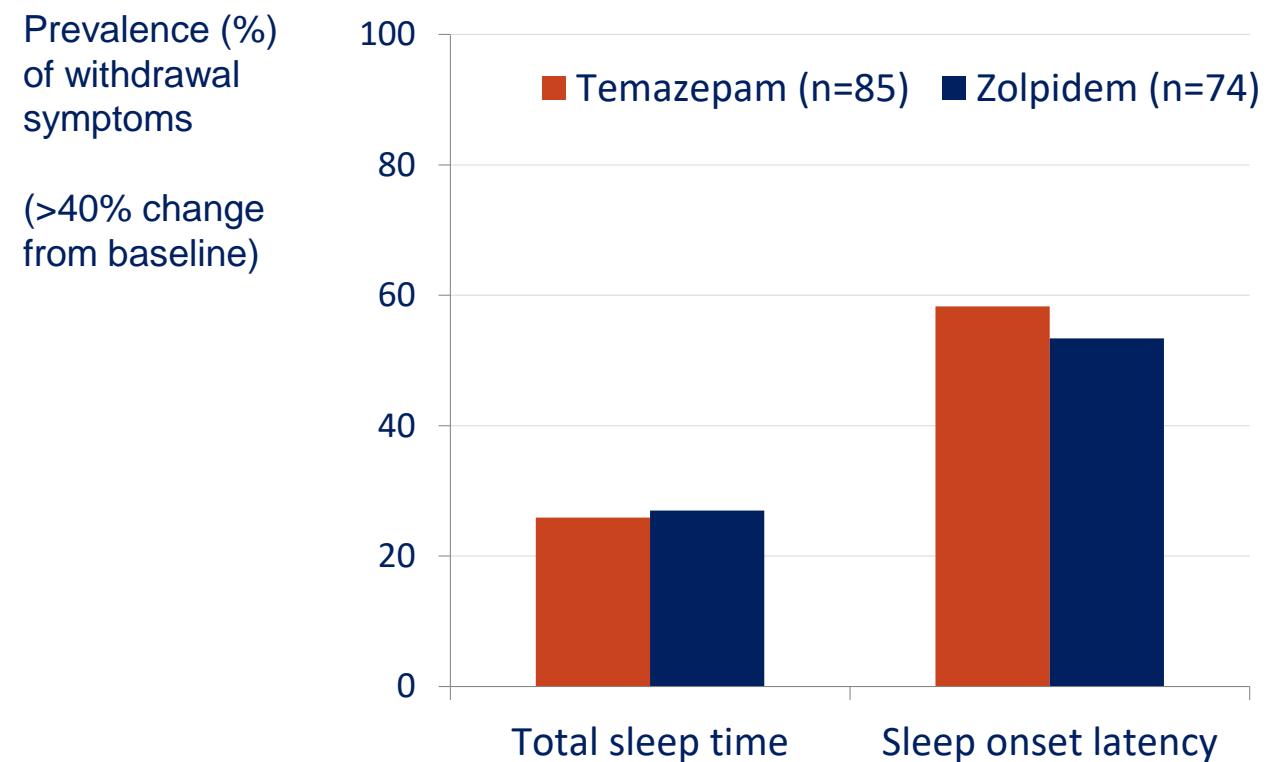

- Clinicians should explore the patients' expectations of the effects of BZDs and focus on how to cope with craving.

# Z-drugs: Selective for the alpha1 subunit

## ARTICLES

### Neural bases for addictive properties of benzodiazepines

Kelly R. Tan<sup>1</sup>, Matthew Brown<sup>1\*</sup>, Gwenaël Labouébe<sup>1\*</sup>, Cédric Yvon<sup>1\*</sup>, Cyril Creton<sup>1</sup>, Jean-Marc Fritschy<sup>2</sup>, Uwe Rudolph<sup>3</sup> & Christian Lüscher<sup>1,4,5</sup>

Benzodiazepines are widely used in clinics and for recreational purposes, but will lead to addiction in vulnerable individuals. Addictive drugs increase the levels of dopamine and also trigger long-lasting synaptic adaptations in the mesolimbic reward system that ultimately may induce the pathological behaviour. The neural basis for the addictive nature of benzodiazepines, however, remains elusive. Here we show that benzodiazepines increase firing of dopamine neurons of the ventral tegmental area through the positive modulation of GABA<sub>A</sub> ( $\gamma$ -aminobutyric acid type A) receptors in nearby interneurons. Such disinhibition, which relies on α1-containing GABA<sub>A</sub> receptors expressed in these cells, triggers drug-evoked synaptic plasticity in excitatory afferents onto dopamine neurons and underlies drug reinforcement. Taken together, our data provide evidence that benzodiazepines share defining pharmacological features of addictive drugs through cell-type-specific expression of α1-containing GABA<sub>A</sub> receptors in the ventral tegmental area. The data also indicate that subunit-selective benzodiazepines sparing α1 may be devoid of addiction liability.

# Meta-analysis on achieving BZD abstinence<sup>1</sup>

	OR	[95% CI]	p-value
Ten controlled withdrawal studies:			
• Withdrawal with psychotherapy (n=4):	<b>5.1</b>	<b>[2.7–9.6]</b>	<b>p&lt;.001</b>
• Withdrawal with pharmacotherapy (n=4):	1.3	[0.7–1.5]	p=.42

- Thank you for your attention!**

# Dokter, mag ik 1 pilletje extra?

---

## Challenge study BZD (side)effects<sup>1</sup>

---

### **Gerandomiseerde, dubbelblinde, cross-over trial:**

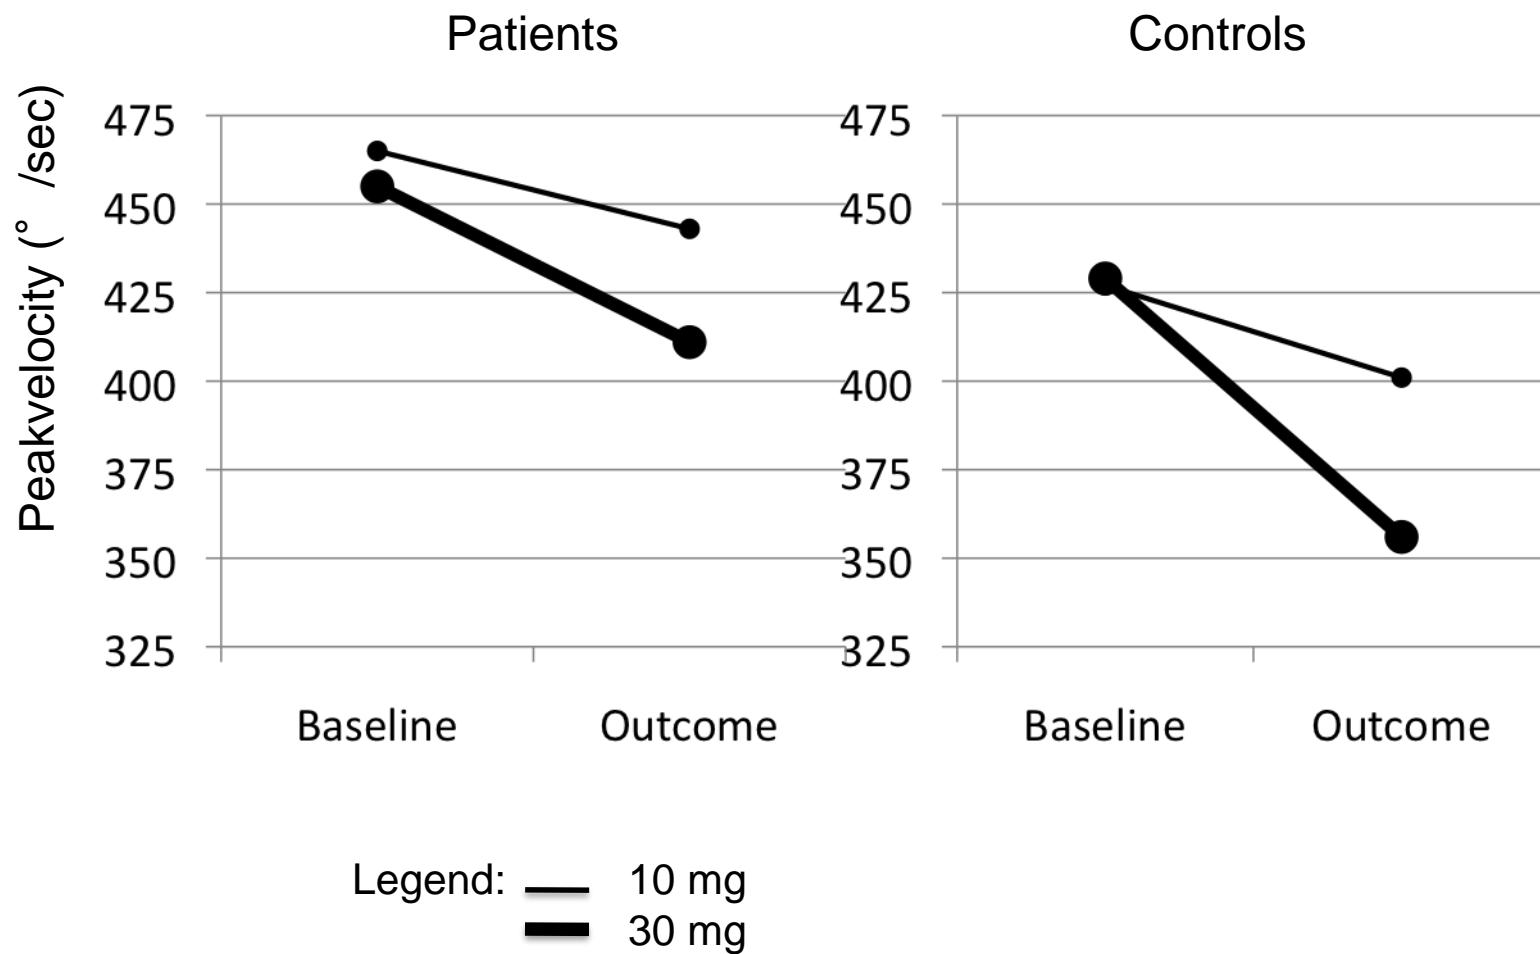

- Overslaan ochtenddosering oxazepam voor komst naar ziekenhuis
- Inname van 10 mg, respectievelijk 30 mg oxazepam
- Patiënten dachten beide dagen 30 mg oxazepam te krijgen

### **Procedure:**

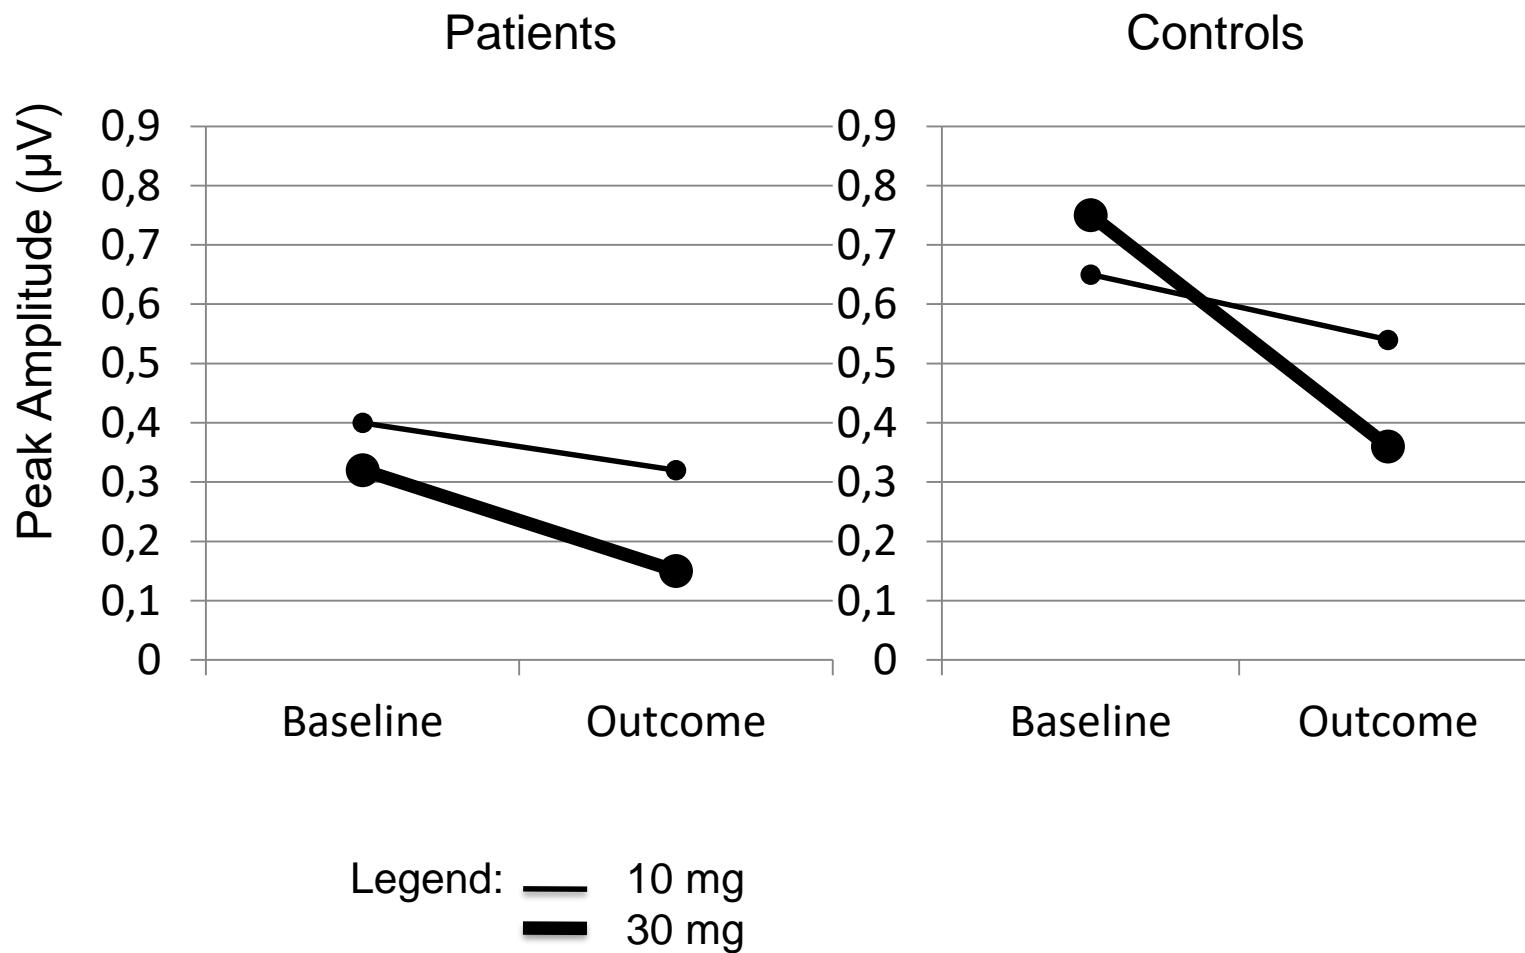

- Baseline meting
- Inname van oxazepam (10 / 30 mg)
- Effect meting na 2.5 uur ( $T_{max}$  oxazepam)

## Quebec Survey on the Health of Older Persons<sup>1</sup>

2,782 persons randomly selected persons aged 65 years or older in Quebec

→ 707 (25.4%) report benzodiazepine usage

→ **67 (9.5%) meet DSM-IV criteria for BZD dependence**  
→ 304 (43%) consider themselves dependent on BZDs

<sup>1</sup> Voyer et al, Can J Aging 2010

# DSM-criteria for substance use dependence

DSM-IV criterion	Dependent BZD users (n=67)	None-dependent users (n=639)
1. Tolerance		
2. Withdrawal		
3. Increases in quantity or duration/ tolerance		
4. Ongoing resolution or fruitless efforts to reduce or cease medication		
5. Takes time to recover from drug effects		
6. Reduction or abandonment of important activities		
7. Continued drug use despite problems caused by use		

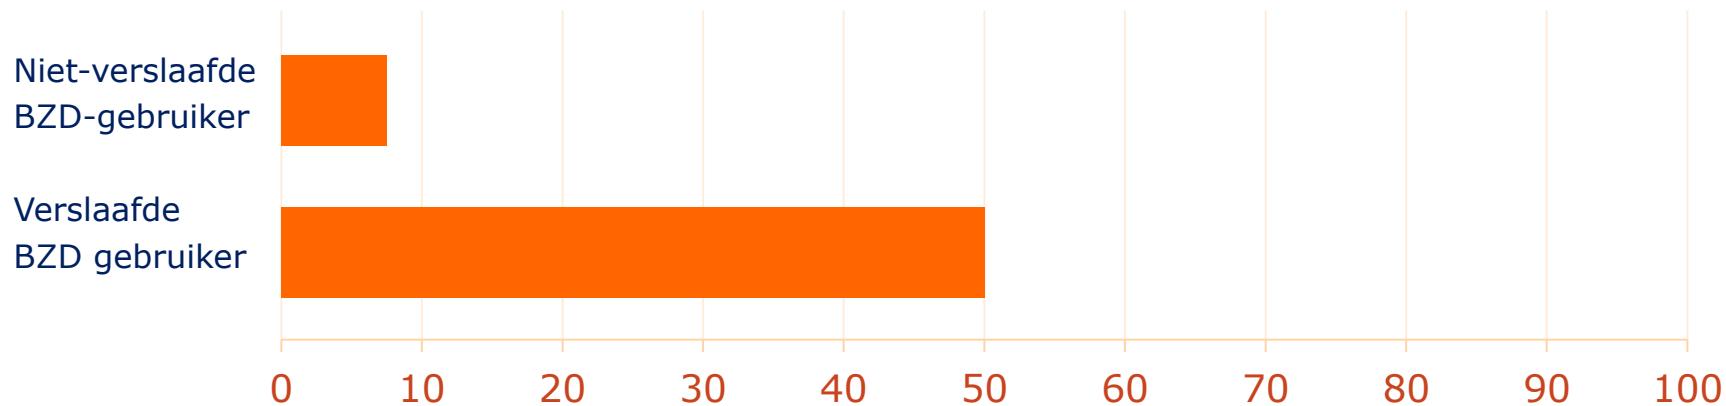

## Criterium 1: Tolerantie

umcg

Heeft u een afname van het effect van deze medicijnen ervaren  
(slaap, angst of somberheid)?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

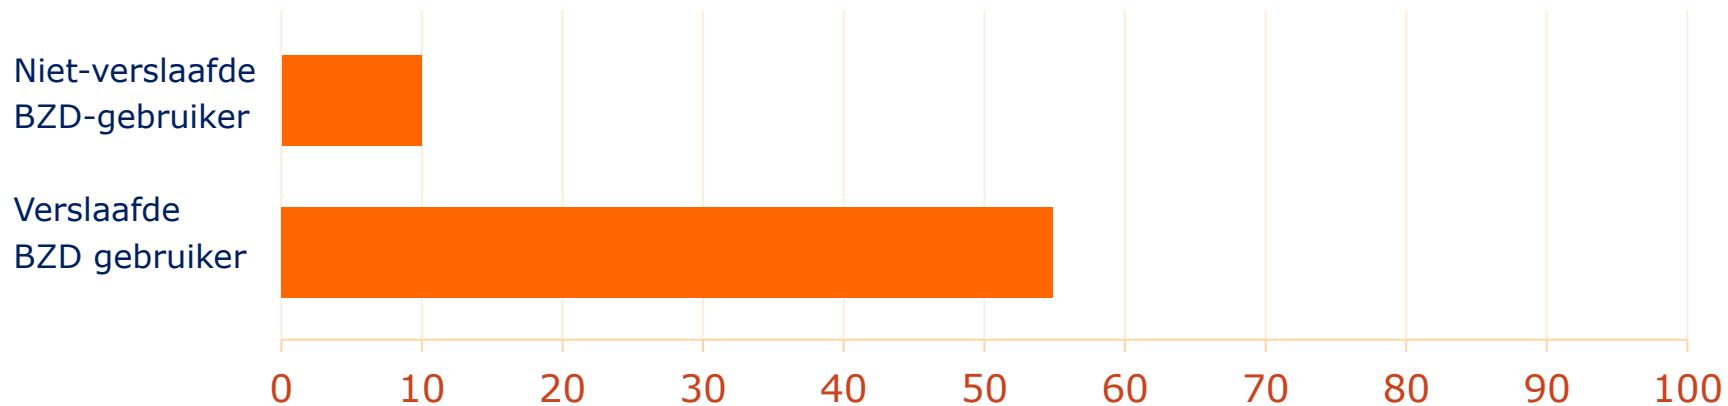

## Criterium 2: Onthouding (1)

Kreeg u lichamelijke klachten (zoals slapeloosheid, beven, zweten, angst) toen u probeerde deze medicatie te stoppen of te minderen?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

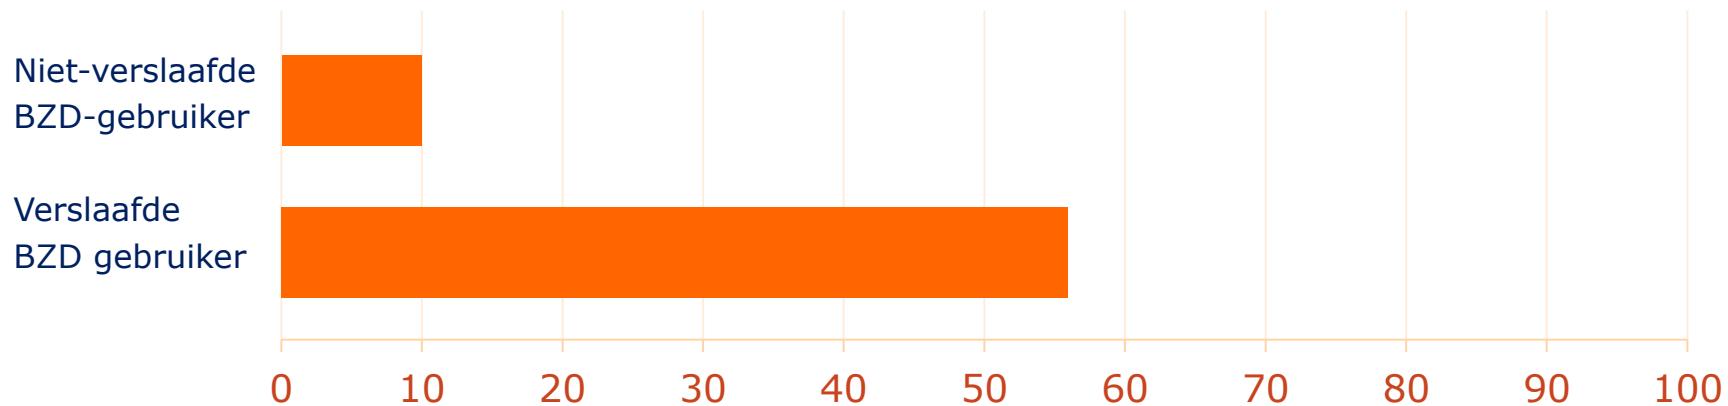

## Criteria 2: Onthouding (2)

Heeft u alsnog BZD of andere stoffen, zoals alcohol, genomen omdat stoppen of minderen te moeilijk bleek?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

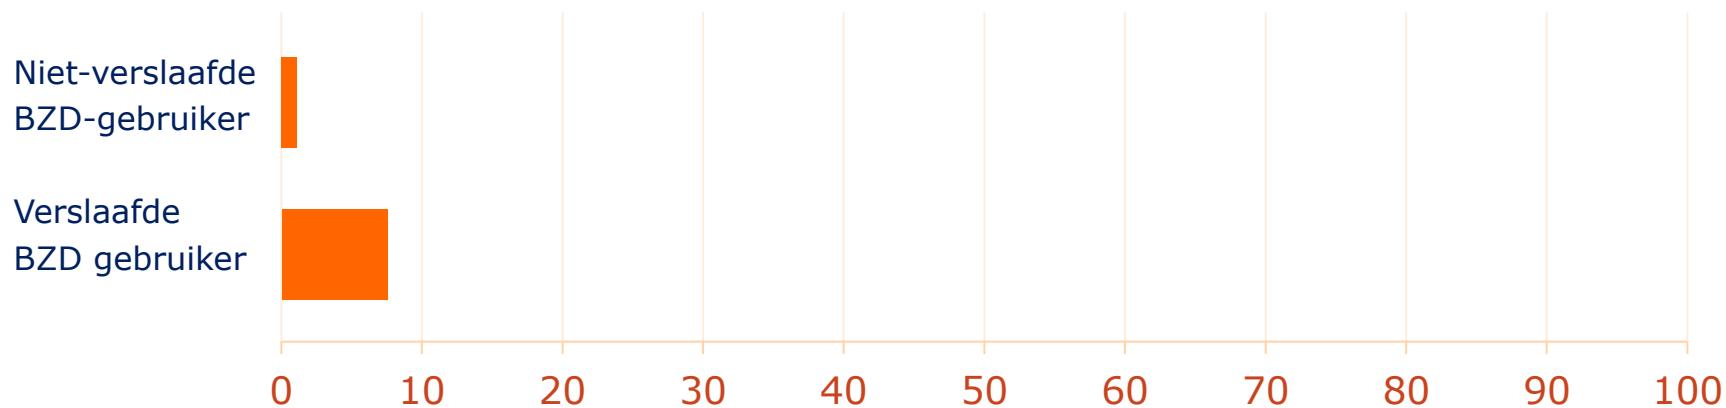

## Criterium 2: Onthouding (3)

Leidde uw poging tot mindering of stoppen tot problemen met familieleden of vrienden óf in het uitvoeren van voor u gebruikelijke activiteiten?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

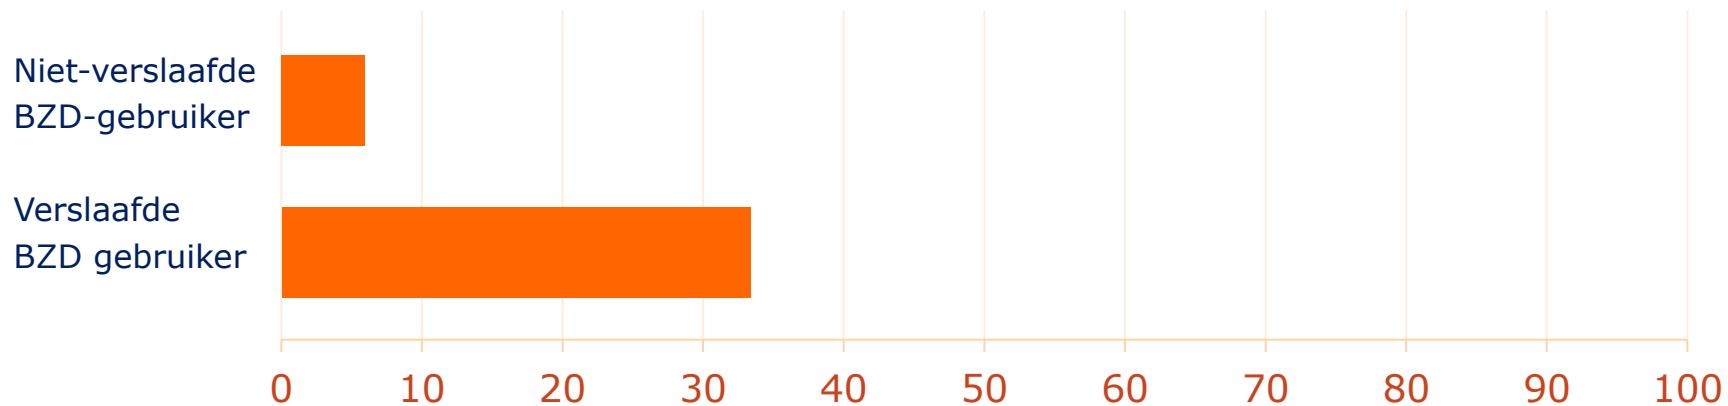

## Criterium 3: Meer of langer gebruikt

Heeft u een grotere hoeveelheid meidcatie (meer pillen of een hogere dosering) moeten nemen om het effect te krijgen wat u graag wilde?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

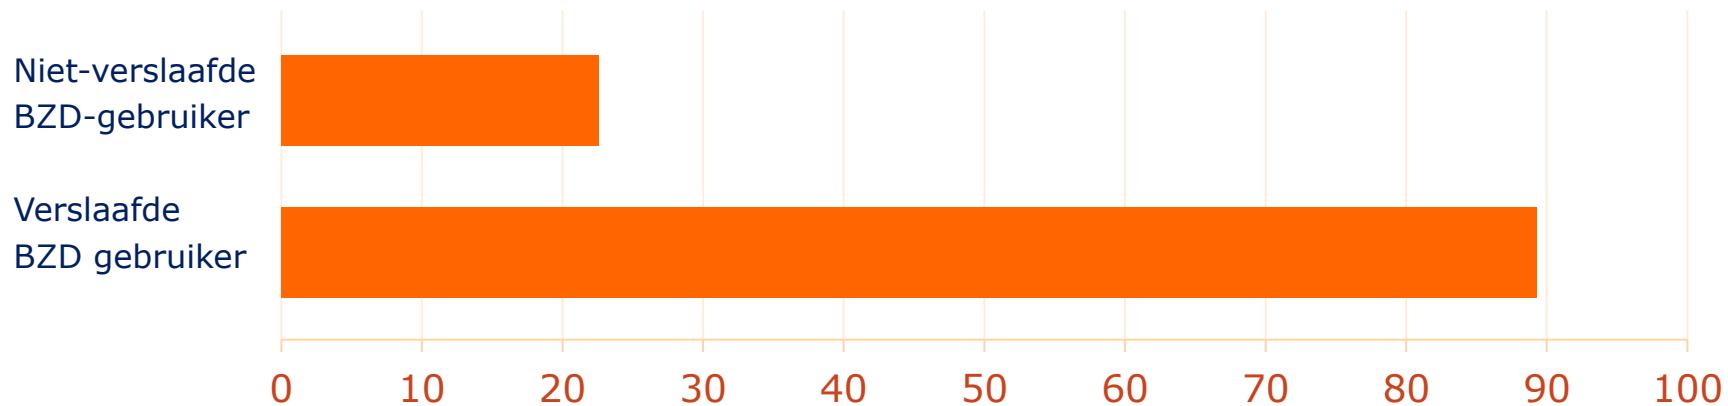

## Criterium 4: Stopwens?

Heeft u geprobeerd te stoppen?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

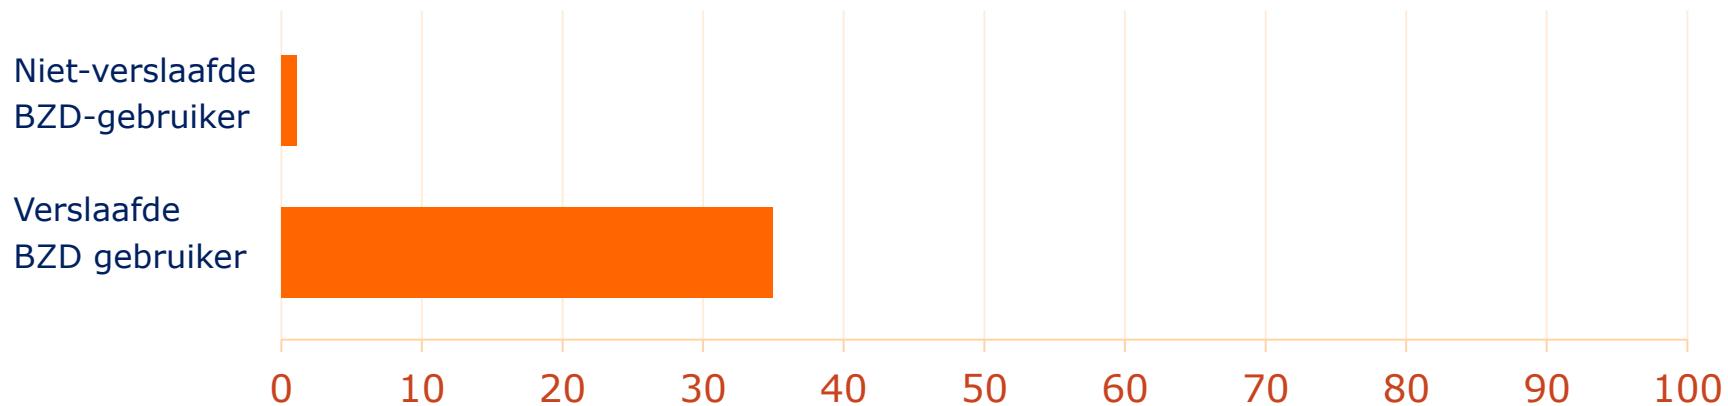

## Criterium 5: Tijdsinvestering?

Heeft u rustperiodes of rusttijden moeten inlassen om te herstellen van de effecten van deze medicatie?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

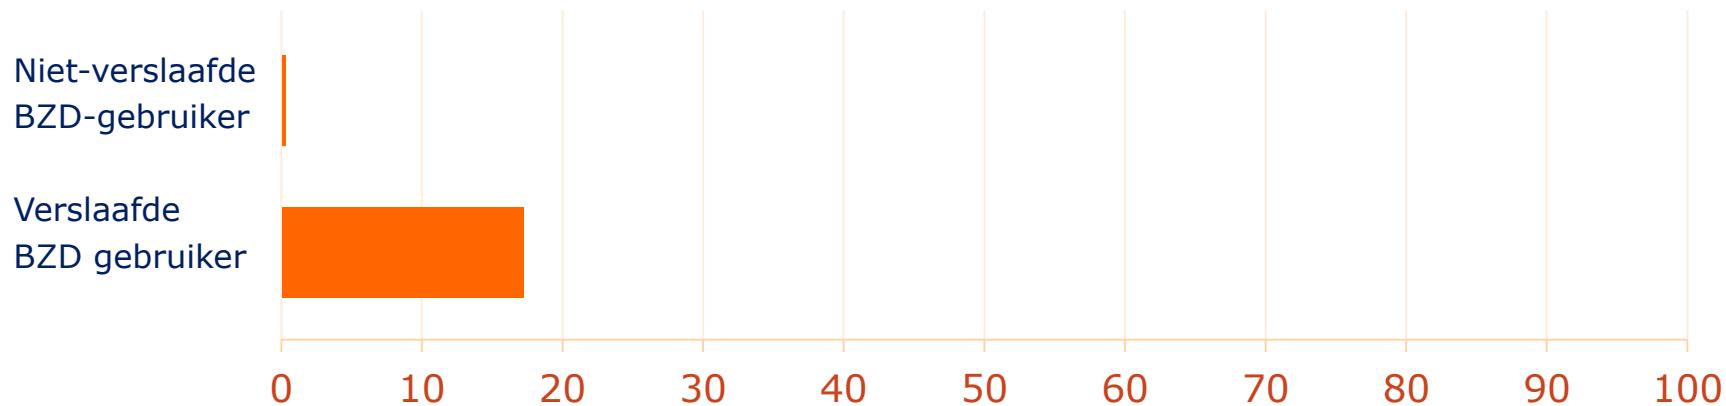

## Criterium 6: Reductie belangrijke activiteiten?

Heeft het gebruik van deze medicatie ertoe geleid dat u bepaalde activiteiten of vrijetijdsbehandeling die belangrijk voor u zijn moeten verminderen of staken?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

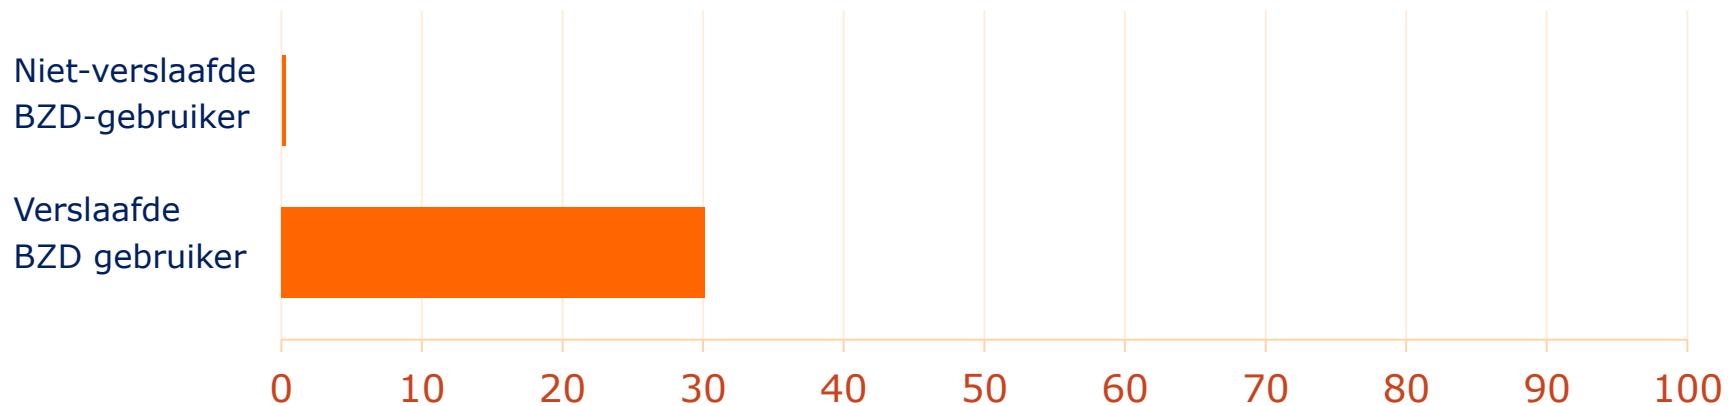

## Criterium 7: Continuering ondanks problemen (1)

Hebben deze medicijnen gezondheidsproblemen bij u veroorzaakt?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

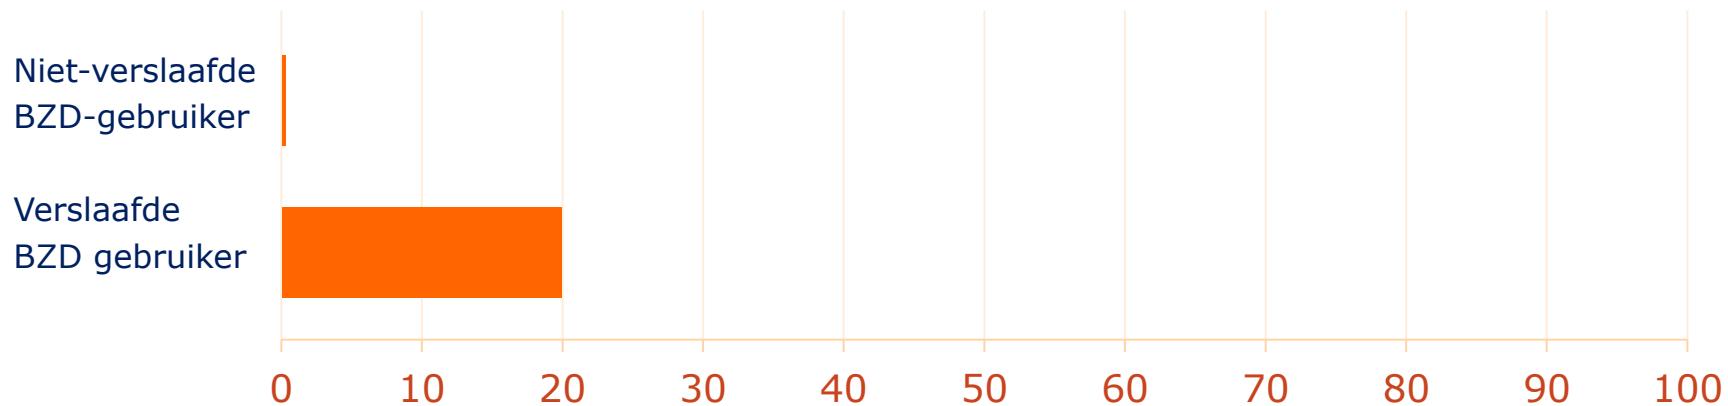

## Criterium 7: Continuering ondanks problemen (2)

Hebben deze medicijnen u problemen opgeleverd zoals ongelukken of bijwerkingen?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

# DSM-criteria for substance use dependence

DSM-IV criterion	Dependent BZD users (n=67)	None- dependent users (n=639)
1. Tolerance	50 %	7 %
2. Withdrawal	56 %	10 %
3. Increases in quantity or duration/ tolerance	33 %	6 %
4. Ongoing resolution or fruitless efforts to reduce or cease medication	89 %	23 %
5. Takes time to recover from drug effects	35 %	2 %
6. Reduction or abandonment of important activities	17 %	0 %
7. Continued use of drug despite problems caused by use	30%	1 %

## BZD: a typical type of dependence?

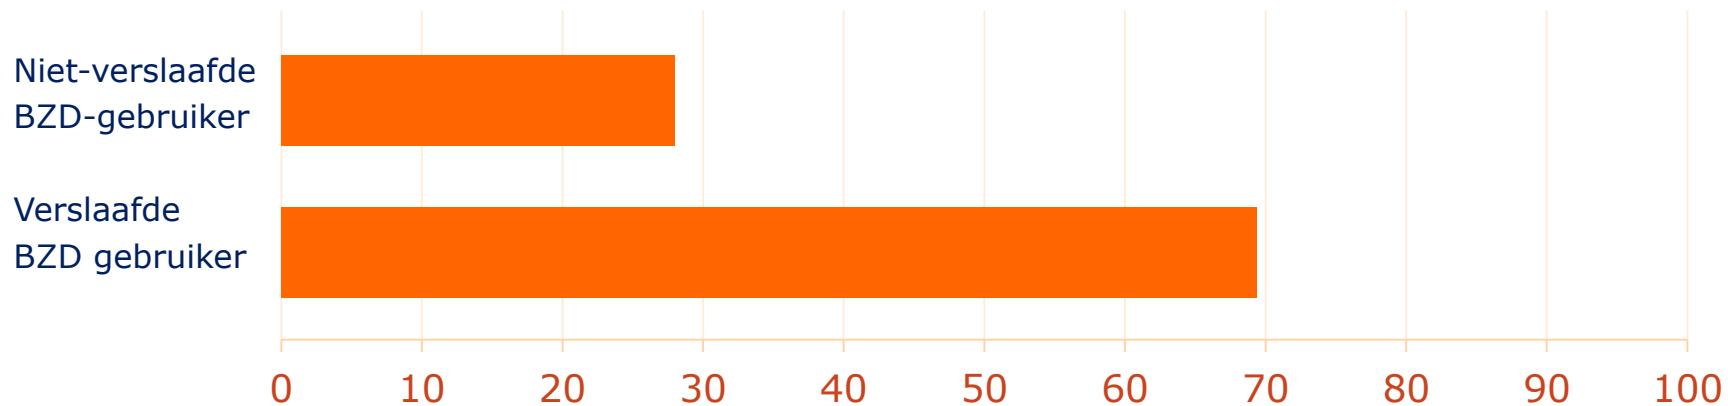

Atypical dependence criteria	Dependent BZD users (n=67)	None-dependent users (n=639)
1. Expressing desire to stop		
2. Giving no reason or several reasons for using		
3. Downplaying effects of the BZD		
4. Perceiving medication as addictive		
5. Attributing unrealistic powers to medication		
6. Wanting to keep a supply of the medication in reserve		
7. Believing that one is dependent on the BZD		

## Atypisch criterium 1: Stopwens?

Denkt u dat het goed zou zijn als u deze medicatie zou stoppen?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

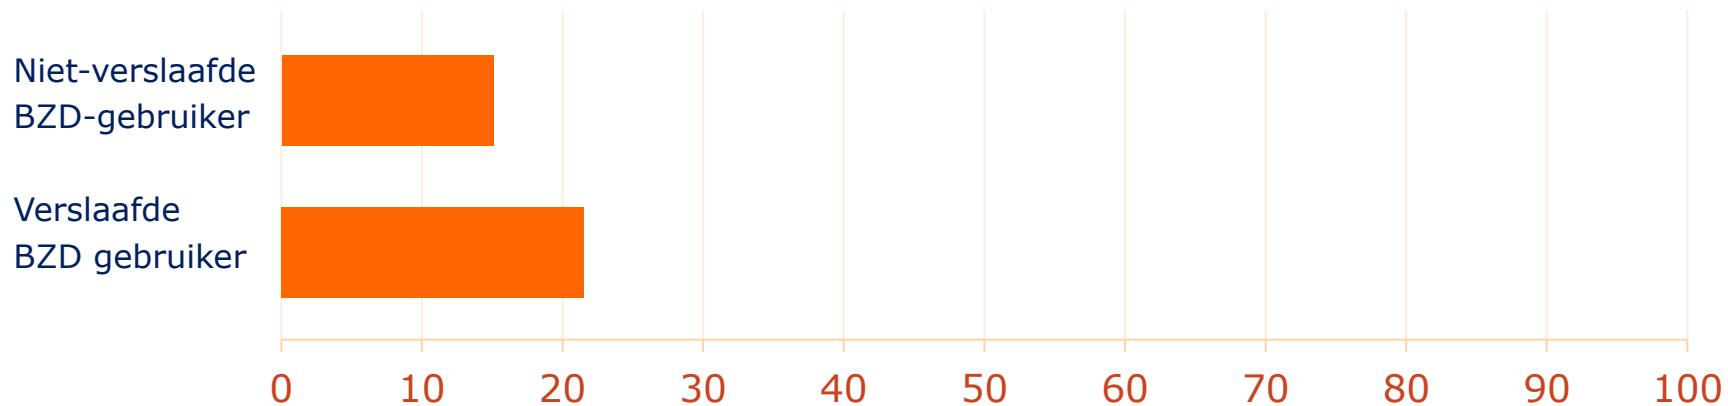

## Atypisch criterium 2: Geen/meer gebruiksreden

Kunt u mij de reden(en) geven waarom u deze medicijnen gebruikt?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

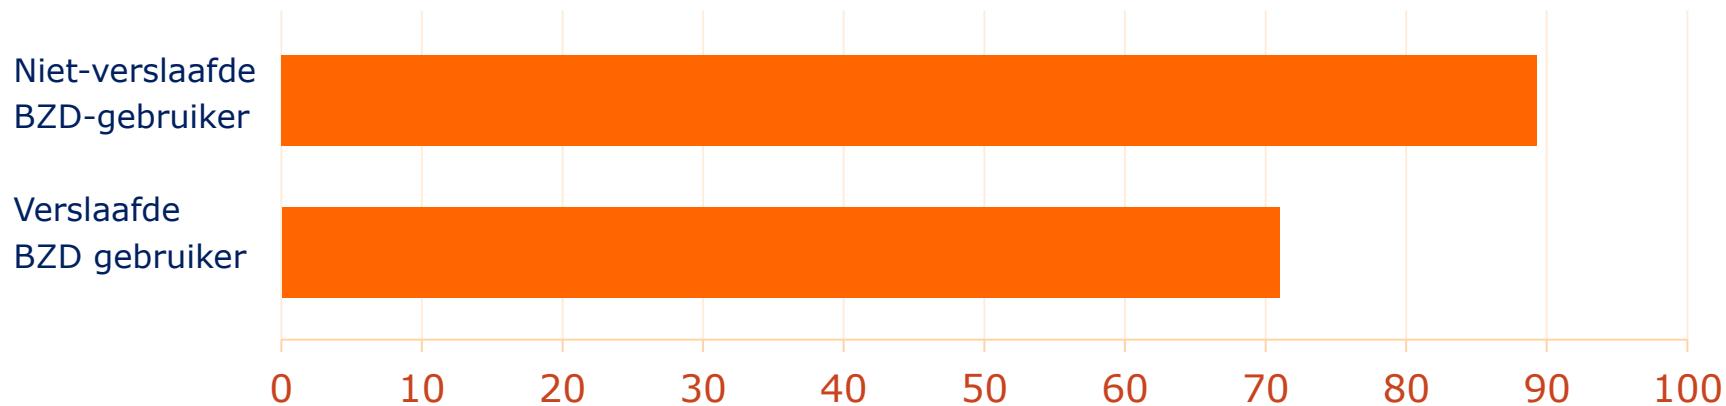

## Atypisch criterium 3: Afzwakken effecten

Klopt het dat de medicijnen die u gebruikt een tablet/capsule is die niet zo sterk of krachtig is?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

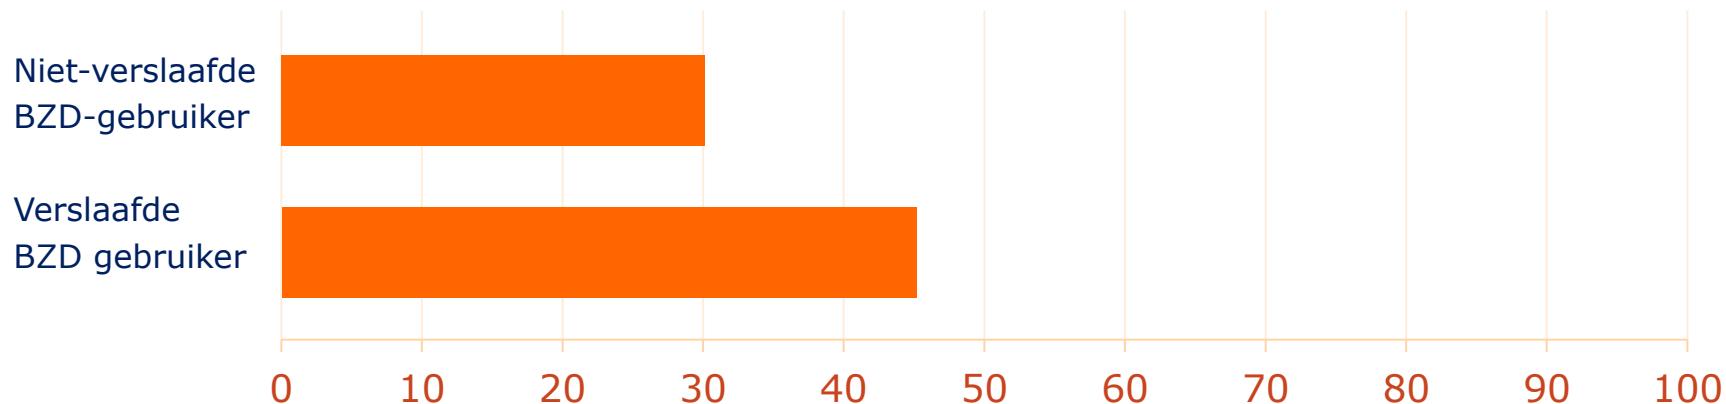

## Atypisch criterium 4: Ervaren als verslavend?

---

Lijkt de medicatie die u gebruikt op iets zoals een sigaret?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

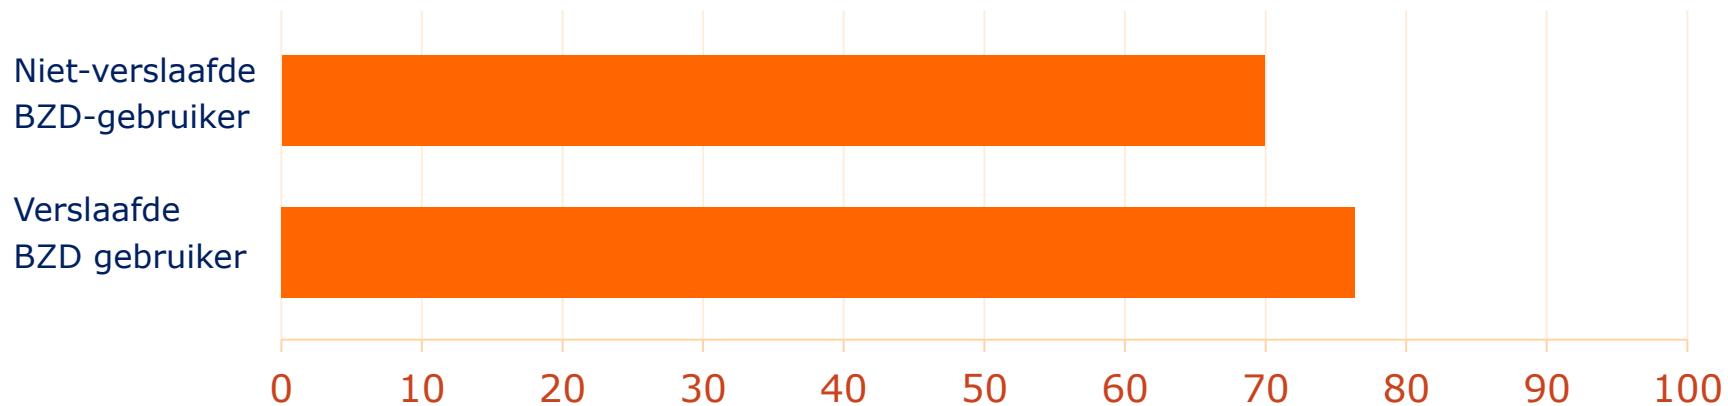

## Atypisch criterium 5: Onrealistische krachten

Kan deze medicatie bepaalde problemen, zoals conflicten met andere mensen, voorkomen?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

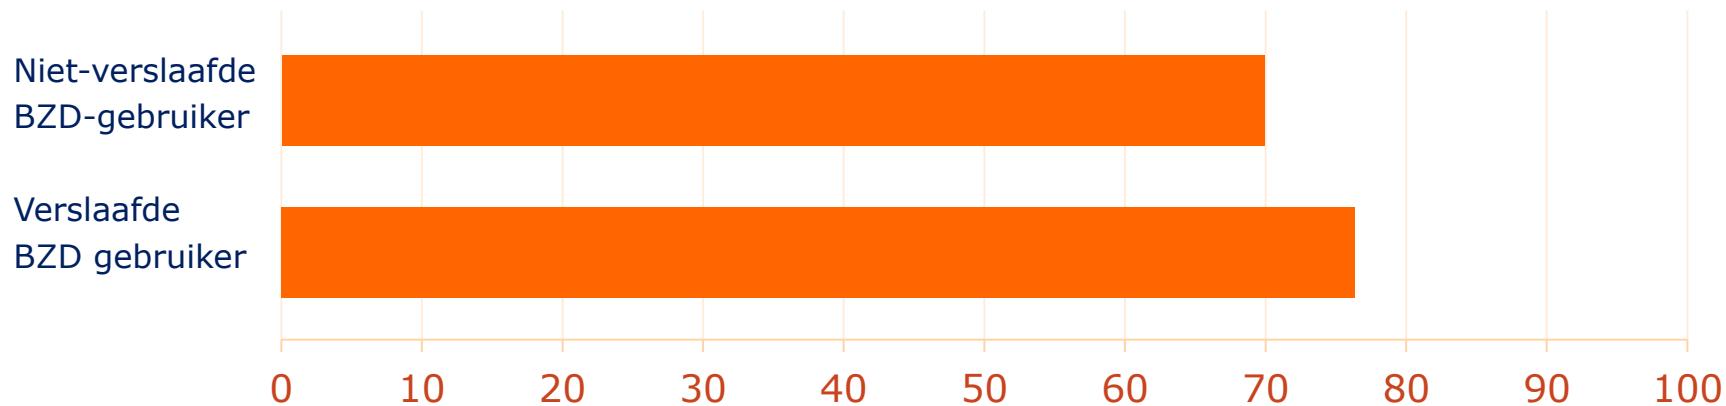

## Atypisch criterium 6: Voorraad / op safe?

Zelfs als u zou stoppen met deze medicatie, blijft het dan belangrijk voor u om er een aantal achter de hand te houden voor het geval dat?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

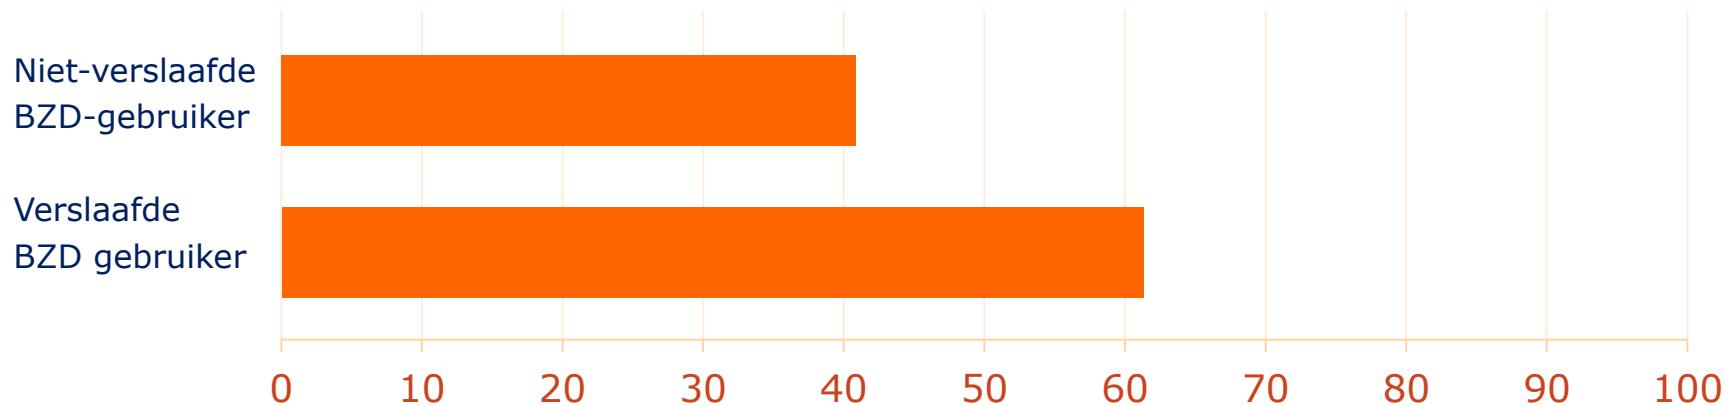

## Atypisch criterium 7: Overtuigd verslaafd?

Denkt u dat u verslaafd bent aan deze medicatie?

Proportie benzodiazepine-gebruikers die deze vraag bevestigend beantwoordt:

# BZD: a typical type of dependence?

---

<b>Atypical dependence criteria</b>	<b>Dependent BZD users (n=67)</b>	<b>None- dependent users (n=639)</b>
<b>1. Expressing desire to stop</b>	<b>69 %</b>	<b>28 %</b>
2. Giving no reason or several reasons for using	22 %	15 %
3. Downplaying effects of the BZD	71 %	89 %
4. Perceiving medication as addictive	45 %	30 %
5. Attributing unrealistic powers to medication	17 %	22 %
6. Wanting to keep a supply of the medication in reserve	76 %	70 %
7. Believing that one is dependent on the BZD	41 %	61 %

# Final conclusions BZD dependence

---

- Prevalence of dependence on benzodiazepines as well as dose-escalation in low-dose users is lower than originally thought
- Dependency characteristics, however, are prognostic determinants of successful outcome of discontinuation strategies.
- Multiple interventions are efficacious:
  - Even without treating underlying illness, psychological functioning does not worsen.
  - But targeted interventions also improve psychological outcome

## Casus 1

- 86-jarige man
- Gebruikt sinds 36 jaar nitrazepam 5 mg
- Zo nodig temazepam 20 mg bij ontwaken (3-4x/week)
- Weigert te stoppen:
  - Nooit problemen gehad
  - Kan niet slapen zonder medicatie (wel geprobeerd)

# Vraag 1: Moet deze man stoppen?

---

## Vraag 1: Moet deze man stoppen?

---

- Redenen op te stoppen:
  - Mislukte stoppogingen vermoedelijk rebound insomnia
  - Slaapt verbeterd na staken
  - Helderder overdag
  - Geen risico op vallen ('s nachts) / heupfractuur
  - Geen risico op ongevallen / cognitieve stoornissen

## Casus 2

- 56-jarige vrouw
- Gebruikt sinds 18 jaar oxazepam, 3 dd 10 mg.
- Gebruikt z.n. 1-2 extra (gemiddeld 4x per week) bij piekeren of spanningsvolle (lees sociale) activiteiten
- Weigert te stoppen:
  - Nooit problemen gehad door oxazepamgebruik
  - Maakt zich onnodig zorgen (piekert) zonder oxazepam

## Vraag 1: Moet deze vrouw stoppen?

## Vraag 1: Moet deze vrouw stoppen?

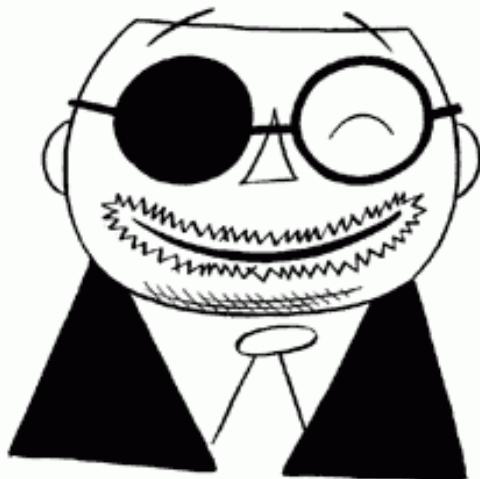

- Redenen op te stoppen:
  - Lager risico op (onge)vallen
  - (beter cognitief functioneren)
  - Oxazepam is veiligheidsgedrag:
    - Ondermijnd zelfvertrouwen
    - Houdt klachten in stand

umcg

# Motiverende gespreksvoering

---

# Motiverende gespreksvoering

- Onvoorwaardelijke aanvaarding patient
- Contact met patient krijgen en houden
- Vermijden van discussie/onenigheid over wel/niet verslaafd  
(niet moraliseren, beschuldigen of confronteren)
- Samenwerken
- Objectieve informatie geven
- Actieve houding en werkrelatie stimuleren
- Gevoel van eigenwaarde vergroten
- Kennis van het probleem opdoen
- Gevoel van self-efficacy vergroten
- Laten nadenken over de ineffectiviteit van bZD m.b.t. eigen klachten gedurende het leven
